1.0 INTRODUCTION

The Douglas Aircraft Company (DAC) C-6 Facility is located at 19503 South Normandie Avenue, Torrance, California (Figure 1). Quarterly groundwater sampling is being conducted in response to the California Regional Water Quality Control Board - Los Angeles Region correspondence to DAC, dated 7 April 1992. This report summarizes laboratory analytical data generated through the chemical analysis of groundwater samples collected during the period of 12 and 13 June 1995, Second Quarter 1995.

2.0 QUARTERLY MONITORING PROGRAM

Second Quarter 1995 groundwater sampling was performed in accordance with standard sampling procedures. Static water level depths were measured on 12 June 1995 prior to initiating purging of groundwater from any observation wells. Static water depths on monitoring wells, MW-18 and MW-19 located in the southern portion of the DAC property installed for the Montrose Chemical Corporation Remedial Investigation were measured for this quarter. However, Montrose monitoring wells MW-8 and MW-9 could not be opened and were not measured.

Groundwater samples were collected from the following fifteen wells (Figure 2) and chemically analyzed for volatile organic compounds (VOCs) by EPA Method 8240/8260 for the Second Quarter 1995.

WCC-1S, WCC-2S, WCC-3S, WCC-4S, WCC-5S, WCC-6S, WCC-7S, WCC-8S, WCC-9S, WCC-10S, WCC-11S, WCC-12S, WCC-1D, WCC-3D, and DAC-P1.

Table 1 summarizes observation well construction details. Tables 2 and 3 summarize the results of chemical analysis of groundwater samples and duplicates for major and minor constituents at the C-6 facility, respectively. Chemicals detected in samples from each observation well are shown in Figure 3. Table 4 summarizes available measured groundwater elevations to date. Estimated groundwater elevation contours for the Second Quarter are

presented in Figure 4. Historical chemical concentration profiles for the indicator chemicals trichloroethene and 1,1-dichloroethene are shown in Figure 5. Copies of laboratory data sheets, laboratory/field Quality Control data sheets, groundwater purge and sample forms, and Chain-of-Custody records are included in Appendices A, B, C, and D respectively.

2.1 Groundwater Sampling Procedures

Prior to collecting groundwater samples from each well, groundwater was purged using an electrical submersible pump that was temporarily installed in the observation well. After lowering the pump to the approximate mid-point of the saturated well screen, approximately three to five wetted casing volumes of groundwater were purged from the well until the following groundwater monitoring parameters had stabilized to within 10% of preceding values: pH, electrical conductivity, temperature and clarity. Purged groundwater was stored onsite in DOT approved 55 gallon barrels pending the results of laboratory analysis of samples.

Following groundwater purging, the submersible pump was removed from the well and a representative groundwater sample was collected using a steam-cleaned stainless steel point-source bailer equipped with top and bottom ball-check valves. The bailer was lowered to the approximate mid-point of the saturated well screen interval and retrieved to ground surface. The contents of the bailer were drained into three to four labeled 40-ml capacity vials, preserved with HCl.

2.2 Field QA/QC Procedures

Duplicate groundwater samples were collected for the sampling rounds on 12 and 13 June 1995 for quality control purposes. The duplicates were collected in three or four HCl-preserved vials each and identified by inserting the collection date after "DW-" (DW-061295 and DW-061395). No further sample identification was provided to the laboratory. Samples DW-061295 and DW-061395 were taken from observation wells WCC-9S and WCC-7S, respectively.

For quality control purposes, trip blanks were also analyzed for both days of sampling and shipping and are identified as TB-031395 and TB-031495.

All groundwater, duplicate, and trip blank samples were transported in ice-cooled chests to Thermo Analytical (formerly Terra Tech Labs, Inc.), Irvine, California using U.S. EPA-recommended Chain-of-Custody procedures.

3.0 EVALUATION OF ANALYTICAL RESULTS

3.1 Groundwater Gradient

Groundwater levels were measured prior to sampling on 12 June 1995 (Table 4 and Appendix C). The shallow zone groundwater elevations over the C-6 facility range from 15.83 feet below mean sea level (MSL) to 17.93 feet below MSL. An estimated potentiometric surface map for the shallow zone as measured on this day is presented as Figure 4. Water level measurements show an average increase of 0.5 feet over the DAC C-6 facility since the April 1995 quarterly monitoring. The groundwater gradient in the shallow zone was generally south-southeast with a southerly directed trough-like depression between observation wells WCC-10S and WCC-12S. Only two of the Montrose monitoring wells MW-18 and MW-19 could be measured. The other two (MW-8 and MW-9) could not be opened. The Montrose wells are screened across the shallow zone. Groundwater elevations in MW-18 and MW-19 are 18.91 and 18.06 feet below MSL, respectively. These elevations are consistent with the south-southeasterly gradient shown in Figure 4.

Insufficient data (two wells) are available to define the groundwater gradient in the deeper zone. Groundwater elevation in the two wells (WCC-1D and WCC-3D) is approximately 16.06 and 17.40 feet below MSL, respectively.

3.2 Analytical Data

The results of chemical analysis of groundwater and duplicate samples are summarized in Tables 2 and 3. Table 2 lists major constituents and Table 3 lists additional minor constituents

of samples tested. The duplicate groundwater samples are indicated by an asterisk and are presented with the "original" groundwater samples. These tables include cumulative analytical data for all monitoring wells and detection limits (where available) for the listed chemicals.

The following observations are noted:

- Background concentrations of TCE and 1,1-DCE in the shallow zone upgradient or cross gradient wells WCC-10S, WCC-2S, and WCC-11S remain in the range of 100 µg/L of TCE and tens of µg/L of 1,1-DCE.
- Groundwater elevation data (Figure 4) and chemical concentration data (Figure 3) indicate that chemical transport in the shallow zone is in a generally southerly to southeasterly direction in the vicinity of buildings 36 and 41. Most chemical concentration data from the eastern boundary observation wells (WCC-5S, and WCC-9S) are within the same range or lower than upgradient or cross gradient "background level" wells (WCC-10S, WCC-2S and WCC-11S).
- Carbon disulfide was detected for the first time in monitoring wells WCC-1D, WCC-5S, WCC-7S and WCC-10S. Concentrations ranged from 2.2 to 37 mg/L. The highest concentration was observed in a duplicate of sample WCC-7S. However, the concentration of carbon disulfide in WCC-7S sample was 8.7 ug/L. Monitoring for carbon disulfide will continue and trends will be noted.
- WCC-6S data showed significant increase in 1,1-DCE, 1,1,1-TCA, cis-1,2-DCE, and toluene compared to concentrations observed last quarter. However, last quarter's data was relatively low, and this quarter's data is more consistent with other historical data. Concentrations of 1,1-DCE and cis-1,2-DCE in this well have shown a general increase since February of 1994.
- Chemical concentration variances within all observation wells (other than WCC-6S discussed above and the carbon disulfide detections) were typical of historical ranges.

- Analytical data from the sample duplicates, trip blanks, and laboratory spikes and duplicates are indicative of reliable data.

Notes:

1. Reference point is north side, top of well casing
 2. Reference point elevation measured by Hargis + Associates, Inc.
 3. Data taken from Woodward-Clyde Consultants Phase II Report, May 1988.
 4. Data taken from Woodward-Clyde Consultants Phase III Report, March 1990.
 5. NA - Not Available - No access to offsite wells.
 6. Installed by Hargis + Associates, Inc. for Montrose Chemical Corporation
- * Water Level Elevation not measured due to wellhead obstructions.

*The MS, MSD & RPD were outside of acceptable QC limits due to possible matrix interferences;
LCS was within acceptable QC limits.

M = Matrix Spike / Matrix Spike Duplicate

L = Laboratory Control Sample Spike / Spike Duplicate

Reviewed:

Approved:

The samples were received by Thermo Analytical in a chilled state, intact and accompanied by the Chain-of-Custody Record.

Acceptance of samples by Thermo Analytical is not an indication of condition upon receipt.

Laboratory Results apply only to the sample matrix analyzed and may not apply to an apparently identical or similar sample.

The Laboratory Report is the property of the client to whom it is addressed.

The Laboratory Results are only a portion of the Laboratory Report.
